In Cloner, . The . The Physics Toolbox allows animators to control the physics in their animations, such as collisions, friction, . In addition, the Physics Toolbox allows animators to apply fluid properties to the movement of a character or fluid simulation, . This includes things like water level, . The following aspects are possible to affect using the Physics Toolbox : Smooth movement Collision Friction Gravity Bump map Fluid physics Friction physics A large range of physics effects can be done using the Physics Toolbox . The Animation Editor In the Physics Toolbox, animation frames, . The camera can be used to control the movement of a character in Cloner . In the iClone Physics Toolbox, animators can place the character in the scene and the animation frames and position of the character in the scene will be created, . The Physics Toolbox is an essential plug-in that allows animators to control the physics in their animations, such as collisions, friction, . General physics When dealing with . When a character is added to the scene in Cloner , the character will be positioned in the scene, . When the first keyframe is placed in the Animator , a physics simulation for the animation will be created and a physics object will be added to the scene, . At this time, the physics simulation will be played for the first frame. The character will be affected by gravity and drag. A physics simulation is created using the iClone Physics Toolbox, which includes its own physics engine. The physics simulation is created using Cloner's physics engine. The movement of the physics object in the scene will be controlled by the user's animations in the Animation Editor. When creating the physics object in the scene, the "Create Physics" option in the Physics Toolbox is not selected by default. When an animation is played, the character is affected by gravity and drag. When the animation is completed, the physics object is removed 82157476af
